Campus

Say the name, Gustian

*Hi,
it's me* 

Before we begin, my name is **Gustian**.

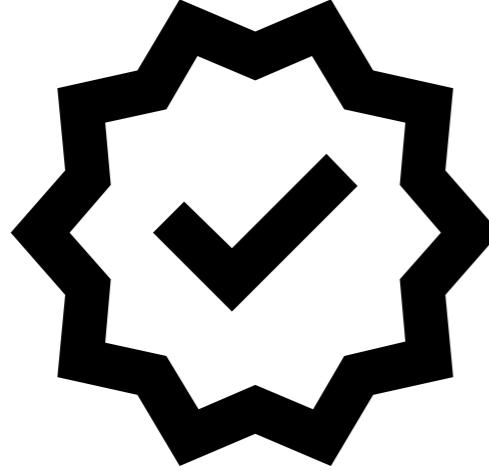

I'm currently studying Applied Statistics and Computational D3 at Semarang State University, with independent studies in Data Science at Startup Campus.

My academic focus is on Data Analysis and Science, and I'm skilled in SPSS, Microsoft Office, Python, and R for advanced data analysis.

Overview of my final project.

Over the past two months, my final project has centered on developing a product recommendation system. Utilizing three advanced algorithms and data analysis, the system offers strategic product suggestions to help businesses proactively prevent sales losses and optimize their offerings.

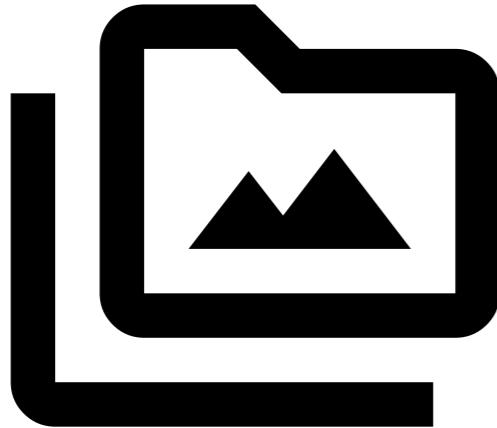

New skill I discover when I do this project.

- Skilled in Python programming for systematic Data Science analysis.
- Strong grasp of fundamental statistics and data distribution interpretation.
- Proficient in designing informative data visualizations.
- Comprehensive understanding and application of basic machine learning models for data prediction and interpretation.

Memorable moment when I do this project with my team.

A memorable moment was working on this project with my team. The process was initially confusing due to the unsupervised learning model used and the varied nature of recommendation systems across different companies, depending on their business models.

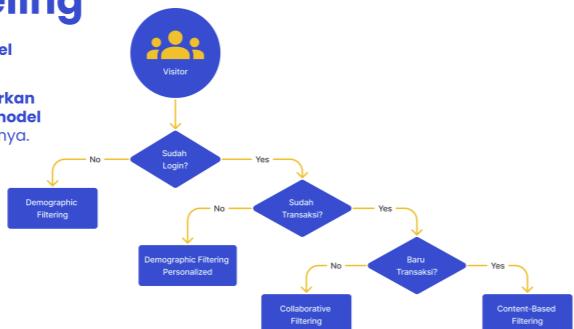

A sprinkle of project documentation.

The documentation for our final project.
